

The given line graph compares the consumption of electricity in England during winter and summer measured in units whereas second pie chart depicts the usage of electricity for different appliances used in English home. Overall, consumption of electricity is greater in winter as compared to summer season.

Initially, Consumption of unit is divided into 2 parts i.e. 12 hours each. In the first 6 hours we see there is a drop in the usage of electricity in winter and similar ^{patterning} is seen in summer. After 6 hours, a massive increase in consumption of electricity can be noticed. At 12 o'clock, the electricity demands increase steadily. From 13 to 19 hours the consumption of electricity remains constant at 17,000 in summer and 9,000 during winter. Both the seasons at 20 hours there is a dynamic increase and then it decreases significantly.

According to the pie chart around 60% of the usage electricity used for heating rooms, and heating water and 17.5% is used for food mixer, electric tools and vacuum cleaners. Remaining usage is equally divided - ovens, Kettles and washing machine. Remaining is equally used for lighting, TV, radio, vacuum cleaner, food mixer and electric tools.

Overall, Both in summer and in winter there is a ^{huge} (increase) in electricity consumption ^{which} is used for heating water.
