

The given graph depicts the use of water in two countries in 3 ~~sectors~~ different sectors i.e. Agriculture, Industrial and domestic from the year 1900 - 2000. Overall shows that water is consumed maximum by agriculture sector.

In the first 50 years there is no significant change from 1900 - 1950 between industrial and domestic sector. They consume least amount of water i.e. around 100 km^3 whereas in agriculture use around 500 m^3 in the same year i.e. 1900 which is 5 times more than other two sectors.

In 2nd half of the century water consumption in 2 sectors shows a slight change and significant increase is seen in industrial sector whereas

Consumption increased from 1000-3000 km³ which is highest for the agriculture sector.

After the 2nd half of the century i.e. 1950-2000, rise in the usage of water is observed in all the different sectors. In 2nd half industrial shows significant use of water increased to 10 times i.e. from 100 km³ to 1000 km³ and yet the agriculture sector topped the list.

According to the table, Brazil and Congo has a big gap in term of population and other aspects. The irrigated land is about 26,500 km² which is massive as compare to Congo which is close to 100 km². ^{260 times more} In Congo, population is around 5.2 million which is around 30 times less than that of Brazil. ^{Even usage of water is 40 times more} Thus, there is a huge difference between Brazil and Congo.

Overall, it shows that water used by the agriculture sector is maximum and ^{domestic} industrial sector has the least consumption.
